

1. Roubutness check for unethical alone condition to eliminate anchoring effect.
- Without giving scores for verbatim and gist truth first, the models have even higher tolerance for Palters. The verbatim and gist scores do have an anchoring effect.

cell	joint	isolated	Δ	p (paired, n=24)
whole truth	1.09	1.00	+0.09	ns
palter	3.77	3.12	+0.65	.002
truthful falsehood	1.95	2.16	-0.20	ns
blatant	5.63	5.85	-0.22	ns

2. Language effect tests with two approaches: prompts and CoT in EN, ZH, and JA.
- Across three languages, the moral judgement for misinformation stays the same, only KIMI K3(a new flagship Chinese model) shows higher tolerance when prompting in Chinese.
- All models reason in English in default, even though guide them to use other languages to reason, they would still use English for reasoning.
- In the intermediate layer the models should all use English for processing, thus their results are the same.
